

## How to Overwrite Images using FTP?

1. Install FTP client (Filezilla)
2. Open Filezilla
3. Click File >> Site Manager...

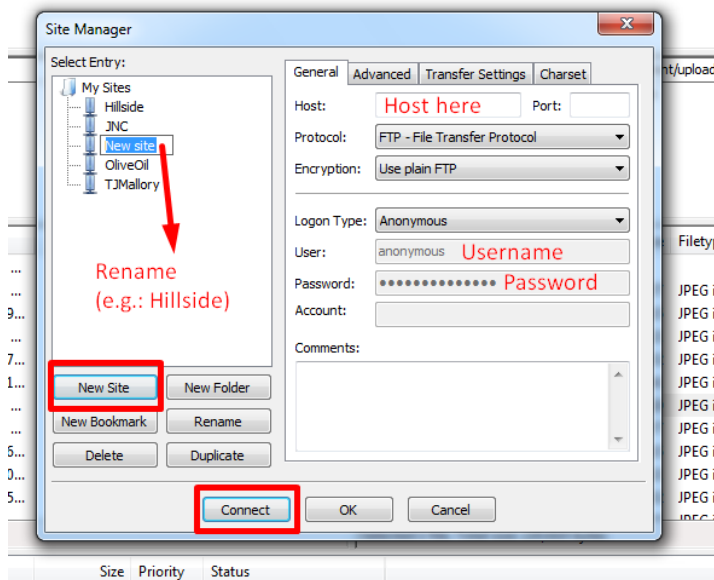

4. Click New Site button
5. Rename the highlighted "New site" – for example: Hillside
6. Enter the Host, username & password:

Hostname: 184.73.158.53

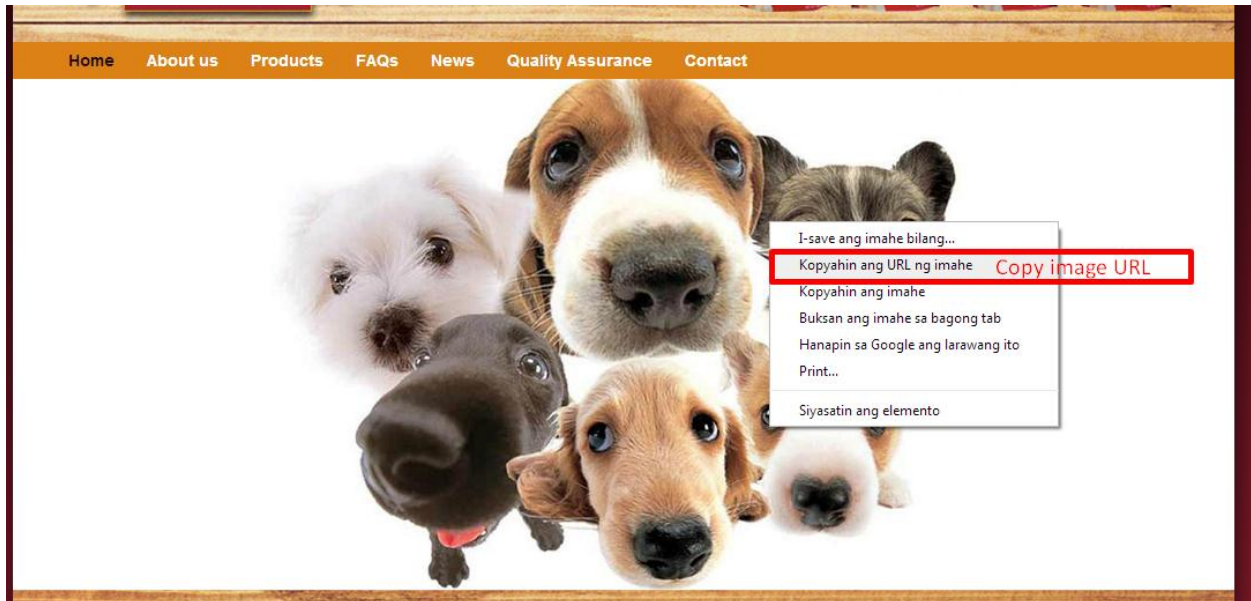

User: benee

Pass: Bg123!@#

7. Click "Connect"

- Before overwriting any image, locate first the URL of that particular image.
- Go to site, right click the image (*sorry my browser is set to Filipino, I change it to English but nothing happens*)

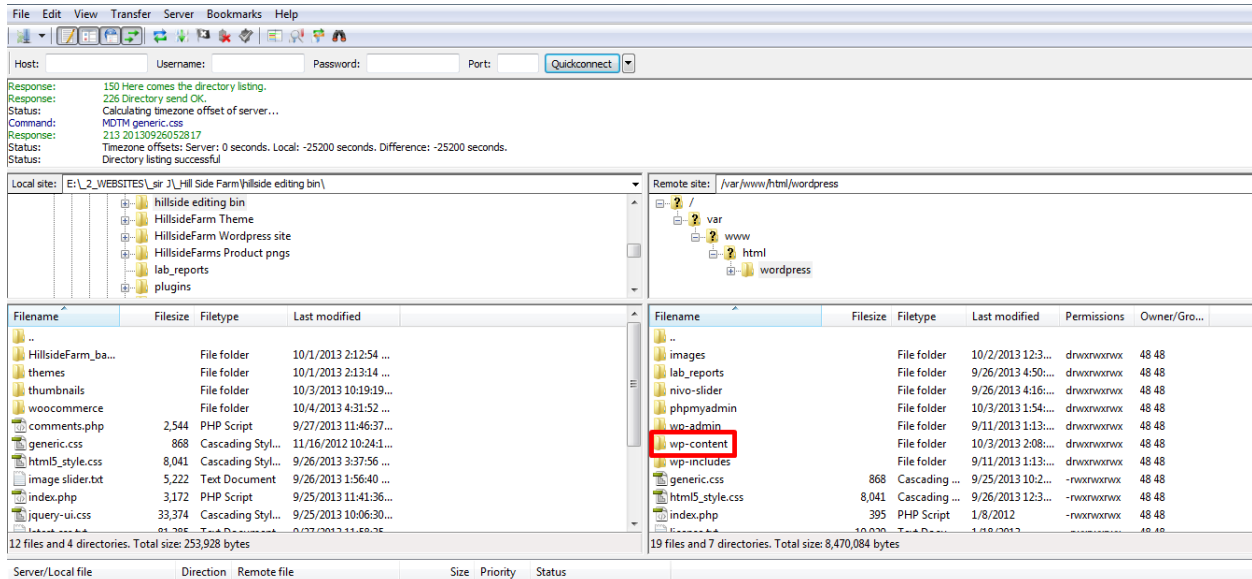

- Paste it to notepad or in the browser.

As you can see, it is uploaded to `/wp-content/uploads/2013/09/banner03.jpg`

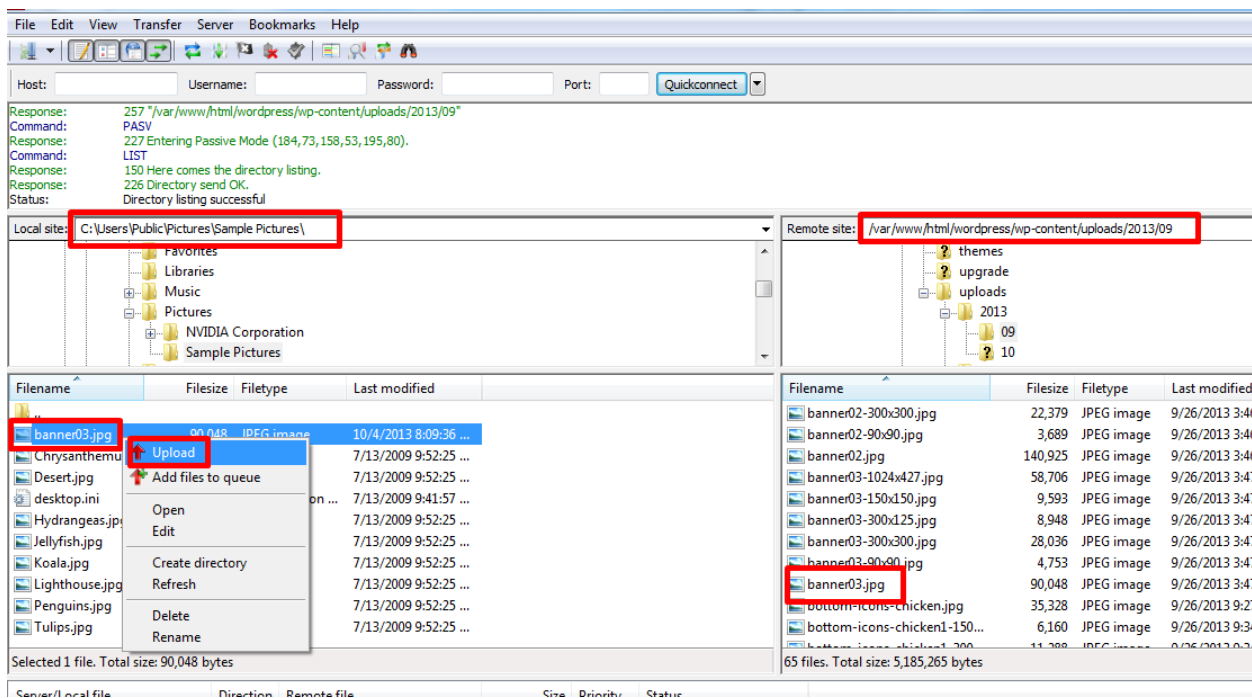

Wordpress automatically assigned the folder 2013 & 09. So better check the URL first to make sure the exact folder.

11. Now you are connected to FTP (Filezilla). On the right side, click: **wp-content**

12. Click: **uploads** then **2013**, then **09** until you see the image: **banner03.jpg**

13. On left side of your FTP, locate your image with the same filename.

14. Click **Upload**.

15. If this screen pops, check **“Always use this action”** and click **OK**

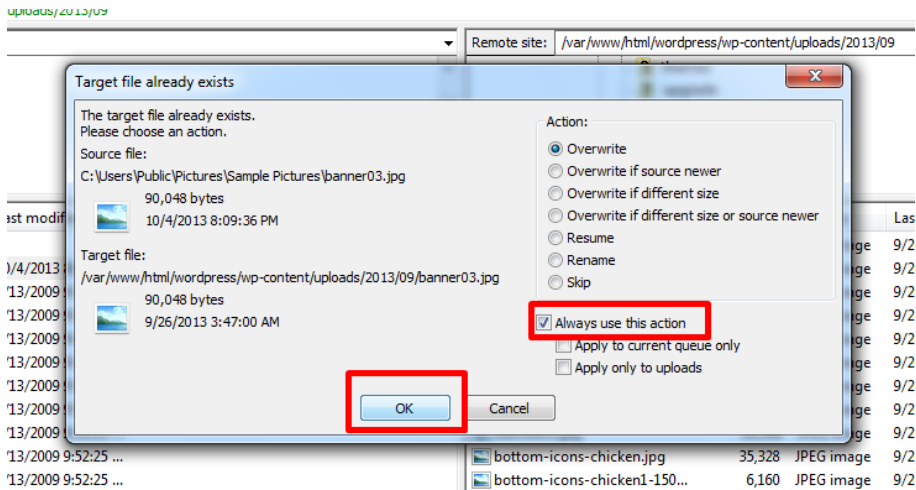

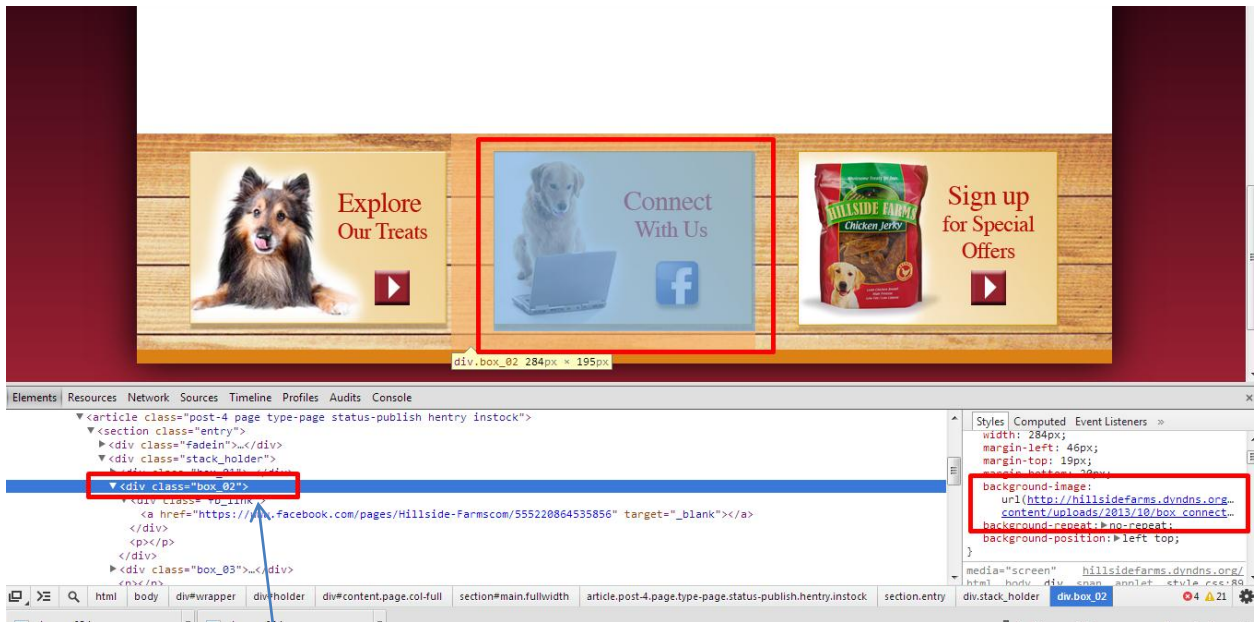

Image is now overwritten.

NOTE: There are some instances that you cannot locate the image URL by just doing the “right click” “Copy URL” because the image was set as a background.

Please check this screenshot:

Right click these 3 boxes and there’s no URL. You can see the URL by “right click”, “inspect the element”

- Right click the box, choose "Inspect the element"
- You can see the html (something like `<div class="box_02">`)
- Scroll the panel on the right side and you can see the tags:

**background-image:** [url\(http://hillsidefarms.dyndns.org/content/uploads/2013/10/box\\_connect.jpg\)](http://hillsidefarms.dyndns.org/content/uploads/2013/10/box_connect.jpg)

- This is the image URL. Locate the Folder 2013 and Folder 10 on your ftp. (As you can see, there is a folder now named 10. – Wordpress automatically set this folder.)
